

Supporting Child & Youth Services with a Single System

Connecting the people, processes, and information that shape outcomes across Child & Youth Services.

Children and families don't just experience care through programs—they experience it through relationships. Those relationships are supported by a complex ecosystem of people, providers, state and county agencies, payers, and community partners that must work together to coordinate care and support positive outcomes. Yet critical information is often scattered across disconnected systems, spreadsheets, paper files, and manual processes, making it difficult to share information across organizational boundaries. Arize brings the ecosystem together in a single configurable platform, connecting children, foster parents, foster homes, workflows, financial processes, and external partners through a shared source of truth. The result is better care coordination, stronger collaboration, reduced administrative burden, and more time focused on children and families.

Benefits of Arize EHR for Child & Youth Services

-  Reduce administrative burden and empower frontline staff to focus on their work with children and families.
-  Create a single source of truth for the full ecosystem of care.
-  Improve collaboration and information exchange across caregivers, providers, payers, and partners.
-  Simplify workflows, compliance, approvals, and care coordination.
-  Strengthen reporting, reimbursement accuracy, and financial oversight.

Supporting the Evolving Needs of Children, Families, and CYS Providers

Better Care Coordination:

Children in CYS care are supported by a network of people, providers, and partner agencies that all need access to timely, accurate information. Yet data is often scattered across systems, which creates challenges for care coordination and increases the risk of delayed services, placement disruptions, and missed chances to impact a child's well-being.

Arize creates a connected view of the child's support network. Organizations can track placements, incidents, services, communications, and key care activities while ensuring critical information is available to the people who need it. As a result, organizations can strengthen care coordination and make more informed decisions that support better outcomes.

Stronger Support for Parents:

Many organizations still manage foster parent recruitment, licensing, communication, and reimbursements through manual processes and disconnected tools. At a time when many communities face shortages of foster families, organizations cannot afford administrative barriers that make supporting these parents more difficult.

Arize provides a dedicated foster parent record and secure caregiver access, enabling parents to manage home information, licensing requirements and documentation, and view placements and respites. Providers can simplify key processes that keep parents engaged, from onboarding to ongoing support.

Greater Visibility into Homes:

Managing foster homes requires ongoing oversight of licensing, inspections, incidents, placements, capacity, and compliance activities. When this information is spread across multiple systems, organizations may struggle to evaluate placement options and maintain visibility into home readiness.

Arize provides a centralized foster home record that connects children, foster parents, staff, home information, licensing documentation, placements, availability, respite services, and compliance activities in a single view. Organizations can also build workflows around critical processes such as inspections, renewals, safety reviews, and incident management, which helps improve visibility and accountability.

More Connected CYS Operations:

CYS organizations are often forced to manage critical operations across multiple systems, which creates duplicate data entry, inconsistent information, reporting challenges, and compliance risk. Further, when information can't move easily between systems, it can delay services and limit visibility into outcomes.

Arize unifies people, processes, and information within a single platform while enabling seamless integration and information exchange across the full ecosystem of care. This helps CYS organizations strengthen collaboration and accountability, simplify operations, and further their mission.
